1. Введение

1.1. Постановка задачи

Рассмотрим систему уравнений, описывающую нестационарное движение вязкого баротропного газа:

$$\begin{cases}
\frac{\partial \rho}{\partial t} + div(\rho u) = \rho f_0 \\
\rho \left(\frac{\partial u}{\partial t} + (u, \nabla)u\right) + \nabla p = Lu + \rho f \\
Lu = div(\mu \nabla u) + \frac{1}{3} \nabla (\mu div(u)) \\
p = p(\rho)
\end{cases} \tag{1}$$

В нашей задаче L - линейный симметричный положительно определеннный оператор. Через μ обозначен коэффициент вязкости газа, который будем считать известной положительной константой. Известными также будем считать функцию давления газа p (в данной работе будем рассматривать $p(\rho) = C\rho$, где C - положительная константа) и вектор внешних сил f, где f - функция переменных Эйлера:

$$(t, x) \in Q = \Omega_t \times \Omega_x = [0; T] \times \mathbb{R}^d$$

Неизвестные функции: плотность ρ и скорость $u=(u_1,\ldots,u_d)$ также являются функциями переменных Эйлера.

Система (1) дополнена начальными и граничными условиями:

$$(\rho, u)|_{t=0} = (\rho_0, u_0), \qquad x \in [0; X]$$

 $u(t, x) = 0, \qquad (t, x) \in [0; T] \times \partial \Omega_x$ (2)

Перепишем систему (1) в эквивалентный вид, при условии того, что мы рассматриваем двумерную по пространству задачу:

$$\begin{cases}
\frac{\partial \rho}{\partial t} + \frac{\partial \rho u_1}{\partial x_1} + \frac{\partial \rho u_2}{\partial x_2} = f_0 \\
\frac{\partial \rho u_1}{\partial t} + \frac{\partial \rho u_1^2}{\partial x_1} + \frac{\partial \rho u_2 u_1}{\partial x_2} + \frac{\partial p}{\partial x_1} = \mu \left(\frac{4}{3} \frac{\partial^2 u_1}{\partial x_1^2} + \frac{\partial^2 u_1}{\partial x_2^2} + \frac{1}{3} \frac{\partial^2 u_2}{\partial x_1 \partial x_2} \right) + \rho f_1 \\
\frac{\partial \rho u_2}{\partial t} + \frac{\partial \rho u_2^2}{\partial x_2} + \frac{\partial \rho u_2 u_1}{\partial x_1} + \frac{\partial p}{\partial x_2} = \mu \left(\frac{4}{3} \frac{\partial^2 u_2}{\partial x_2^2} + \frac{\partial^2 u_2}{\partial x_1^2} + \frac{1}{3} \frac{\partial^2 u_1}{\partial x_1 \partial x_2} \right) + \rho f_2
\end{cases}$$
(3)

1.2. Основные обозначения

Введем на $\Omega_x = \Omega_{x_1} \times \cdots \times \Omega_{x_d}$, где $\Omega_{x_s} = [0; X_s]$, $s = 1, \dots, d$ и Ω_t сетки:

$$\omega_t = \{n\tau : n = 0, \dots, N\}, \tau = \frac{T}{N}$$

$$\omega_{h_s} = \{mh_s : m = 0, \dots, M_s\}, h_s = \frac{X_s}{M_s}$$
(4)

Введем следующие обозначения:

$$h = (h_1, \dots, h_d)$$

$$\omega_h = \omega_{h_1} \times \dots \times \omega_{h_d}$$

$$\omega_{\tau,h} = \omega_{\tau} \times \omega_h$$

$$\gamma_{h,s}^- = \omega_{h_1} \times \dots \times \omega_{h_{s-1}} \times \{0\} \times \omega_{h_{s+1}} \dots \times \omega_{h_d}$$

$$\gamma_{h,s}^+ = \omega_{h_1} \times \dots \times \omega_{h_{s-1}} \times \{X_s\} \times \omega_{h_{s+1}} \dots \times \omega_{h_d}$$

$$\gamma_{h,s} = \gamma_{h,s}^- \cup \gamma_{h,s}^+$$

$$\gamma_h = \gamma_{h,1} \cup \dots \cup \gamma_{h,d}$$

$$(5)$$

Для сокращения записи значение обозначим $m=(m_1,\ldots,m_d),\ m\pm q_s=(m_1,\ldots,m_{s-1},m\pm q,m_{s+1},\ldots,m_d),$ значение для произвольной функции f в узле (n,m) через f_n^m . Для простоты вместо вместо $f_m^n,\ f_m^{n+1}$ и $f_{m\pm q_s}^n$ будем писать $f,\ \hat f$ и $f^{\pm q_s}$ соотвественно.

Введем обозначения для среднего значения величин сеточной функции в двух соседних узлах, а так же для разностных операторов:

$$f_{avg_s} = \frac{f_m^n + f_{m+1_s}^n}{2}$$

$$f_{\overline{avg}_s} = \frac{f_{m-1_s}^n + f_m^n}{2}$$

$$f_t = \frac{f_m^{n+1} - f_m^n}{\tau}$$

$$f_{x_s} = \frac{f_{m+1_s}^n - f_m^n}{h_s}$$

$$f_{\overline{x}_s} = \frac{f_{m-1_s}^n - f_{m-1_s}^n}{h_s}$$

$$f_{x_s\overline{x}_s} = \frac{f_{m-1_s}^n - 2f_m^n + f_{m+1_s}^n}{h_s^2}$$

$$f_{\mathring{x}_s} = \frac{f_{m+1_s}^n - f_{m-1_s}^n}{2h_s}$$

$$f_{\mathring{x}_s\mathring{x}_q} = \frac{f_{m+1_s}^n + f_{m-1_s}^n - f_{m-1_q}^n - f_{m-1_s}^n}{4h_sh_a}$$
(6)

Введем нормы, для определения невязок при выполнении заданий практику-

ма. Обозначим $int\omega_h=\omega_h\setminus\gamma_h$. Тогда для произвольной сеточной функции:

$$||v||_{C} = \max_{x \in \omega_{h}}$$

$$||v||_{L} = \sqrt{\prod_{h} \left(\sum_{x \in int\omega_{h}} v^{2}(x) + \frac{1}{2} \sum_{x \in \gamma_{h}} v^{2}(x)\right)}$$

$$||v||_{W} = \sqrt{||v||_{L}^{2} + \prod_{h} \sum_{i=1}^{d} \sum_{x \in int\omega_{h} \cup \gamma_{h,i}^{-}} v^{2}(x)}$$

где $\Pi_h = h_1 \cdot \ldots \cdot h_d$

2. Разностная схема

2.1. Описание схемы

Для поиска численного решения задачи (1) можно использовать разностную схему, в которой при апроксимации конвективных членов используются центральные разности, а приближенные значения плотности H и скорости V на каждом временном слое ищутся в узлах сетки Ω_h как решения двух СЛАУ, порядок решения которых произволен:

$$H_t + 0.5 \sum_{k=1}^{2} (V_k \hat{H}_{\mathring{x}_k} + (V_k \hat{H})_{\mathring{x}_k} + H(V_k)_{\mathring{x}_k}) = 0, w \in \Omega_h$$
 (2.1)

$$H_t + 0.5((V_k \hat{H})_{x_k} + H(V_k)_{x_k}) - 0.5h_k((HV_k)_{x_k \bar{x}_k}^{+1_k} - 0.5(HV_k)_{x_k \bar{x}_k}^{+2_k} + H((V_k)_{x_k \bar{x}_k}^{+1_k} - 0.5(V_k)_{x_k \bar{x}_k}^{+2_k})) = 0, x \in \gamma_k^-$$

$$(2.2)$$

$$H_t + 0.5((V_k \hat{H})_{\bar{x}_k} + H(V_k)_{\bar{x}_k}) - 0.5h_k((HV_k)_{x_k\bar{x}_k}^{-1_k} - 0.5(HV_k)_{x_k\bar{x}_k}^{-2_k} + H((V_k)_{x_k\bar{x}_k}^{-1_k} - 0.5(V_k)_{x_k\bar{x}_k}^{-2_k})) = 0, x \in \gamma_k^-$$

$$(2.3)$$

$$(V_{k})_{t} + \frac{1}{3}(V_{k}(\hat{V}_{k})_{\mathring{x}_{k}} + (V_{k}\hat{V}_{k})_{\mathring{x}_{k}}) + \frac{1}{2} \sum_{m=1, m \neq k}^{2} \left(V_{m}(\hat{V}_{k})_{\mathring{x}_{m}} + (V_{m}\hat{V}_{k})_{\mathring{x}_{m}} - V_{k}(V_{m})_{\mathring{x}_{m}}\right) + \frac{p(H)_{\mathring{x}_{k}}}{H} =$$

$$= \tilde{\mu} \left(\frac{4}{3}(\hat{V}_{k})_{x_{k}\bar{x}_{k}} + \sum_{m=1, m \neq k}^{2} (\hat{V}_{k})_{x_{m}\bar{x}_{m}}\right) - (\tilde{\mu} - \frac{\mu}{H}) \left(\frac{4}{3}(V_{k})_{x_{k}\bar{x}_{k}} + \sum_{m=1, m \neq k}^{2} (V_{k})_{x_{m}\bar{x}_{m}}\right) + \frac{\mu}{3H} \sum_{m=1, m \neq k}^{2} (V_{m})_{\mathring{x}_{k}\mathring{x}_{m}} + f_{k}, x \in \Omega_{h}$$

$$(2.4)$$

$$\hat{V}_k = 0, x \in \gamma_h^-, k = 1, 2 \tag{2.5}$$

Где:

$$\tilde{\mu} = \max_{m} \frac{\mu}{H}$$

2.2. Координатная запись

Распишем схему приведенных выше обозначениях, и выделим коэффиценты при H и V на n+1 временном слое:

1 уравнение (2.1)

$$H_t + 0.5 \sum_{k=1}^{2} (V_k \hat{H}_{\dot{x}_k} + (V_k \hat{H})_{\dot{x}_k} + H(V_k)_{\dot{x}_k}) = 0$$
